

1 **Subloops**

2
3 **Q. Let’s turn to the sixth section of your testimony. Can you please briefly describe**
4 **Verizon’s subloop proposal?**

5 A. Yes. In its testimony, Verizon proposes to provide CLEC access to subloops in
6 accordance with a pre-established Unbundled Sub-Loop Arrangement (“USLA”).
7 [Sanford and Stern, Direct, p. 37] Under this arrangement, CLECs would only have
8 access to the distribution portion of Verizon’s network at feeder distribution interfaces
9 (“FDIs”). In order to gain this access, potential customers must first pay a fee to file an
10 application expressing the desire to rent subloops connected to a particular FDI. Verizon
11 will then review this application (which must include detailed calculations of potential
12 future demand for subloops in addition to the number currently needed) and, if approved,
13 will provide a cost estimate for the installation of cable connecting the given FDI with a
14 CLEC Outside Plant Interconnection Cabinet (“COPIC”). [Id., pp. 37-38]. After
15 receiving this estimate, if the CLEC still wishes to proceed with the rental, it will then
16 pay a deposit equal to 50% of the estimated cost of the cable and equipment installation.
17 [Id., pp. 37-38] At the completion of the build-out, the CLEC will pay the remaining
18 portion of the total cost incurred by Verizon, regardless of how high this charge might be.

19
20 Verizon also proposes the following:

21
22 In the second stage of USLA provisioning, the CLEC requests the
23 cross-connection of Verizon PA sub-loops from the CLEC end-user to the CLEC
24 feeder facilities at the COPIC. Installation of sub-loops may occur as part of a
25 conversion from Verizon PA retail service or as part of the installation of new
26 service. The CLEC will report the intended use of the sub-loop and request any
27 conditioning (i.e., removal of bridge tap or load coils) at the time of ordering. [Id.,
28 p. 38]

29
30 To initiate this second stage, the CLEC must pay a one-time non-recurring charge for
31 cross-connection of each subloop, and will commence paying the monthly recurring
32 charges. Each additional subloop rented thereafter will also entail payment of these same
33 non-recurring and recurring charges. [Non-recurring Cost Study, Section 4.2].
34

1 **Q. Do the terms and conditions associated with the proposal appear to be reasonable?**

2 A. I cannot comment in detail, since Verizon has not filed a proposed tariff for subloops.
3 However, I will offer a few limited comments based upon the impressions I have gained
4 from the Verizon's testimony and other filings, as well as certain generic descriptions of
5 subloops which are published on Verizon's website.

6
7 **Q. Verizon apparently proposes to only give CLECs the option of renting the entire**
8 **loop from the customer's premises to the FDI. Do you have any concerns regarding**
9 **this aspect of its proposal?**

10 A. Yes. This proposal is unduly restrictive, anti-competitive and inconsistent with FCC
11 requirements. The FCC has held that ILECs must provide unbundled access to subloops
12 wherever this is technically feasible. The FCC specifically defines subloops as:

13
14 portions of the loop that can be accessed at terminals in the incumbent's
15 outside plant. An accessible terminal is a point on the loop where
16 technicians can access the wire or fiber within the cable without removing
17 a splice case to reach the wire or fiber within. These would include a
18 technically feasible point near the customer premises, such as the pole or
19 pedestal, the NID (which we discuss below), or the minimum point of
20 entry to the customer premises (MPOE). Another point of access would
21 be the feeder distribution interface (FDI), which is where the trunk line, or
22 "feeder," leading back to the central office, and the "distribution" plant,
23 branching out to the subscribers, meet, and "interface." The FDI might be
24 located in the utility room in a multi-dwelling unit, in a remote terminal,
25 or in a controlled environment vault (CEV). We acknowledge that some
26 FDIs are more accessible than others; utility rooms are generally more
27 spacious than vaults. A third point of access is, of course, the main
28 distribution frame in the incumbent's central office.[UNE Remand Order,
29 paragraph 206].

30
31 **Q. Why is it necessary to provide a CLEC with a variety of interconnection points to**
32 **access unbundled subloops?**

33 A. CLECs who only need more limited portions of the loop should be given the option of
34 using and paying for the portion they actual need and use. The FCC has found that:

35
36 lack of access to unbundled subloops materially diminishes a requesting
37 carrier's ability to provide services that it seeks to offer. We also conclude

1 that access to subloop elements is likely to be the catalyst that will allow
2 competitors, over time, to deploy their own complementary subloop
3 facilities, and eventually to develop competitive loops. [UNE Remand
4 Order, paragraph 205].

5
6 We believe that a broad definition of the subloop that allows requesting
7 carriers maximum flexibility to interconnect their own facilities at these
8 points where technically feasible will best promote the goals of the Act.
9 Access to portions of the loop element at these points, i.e., access to the
10 subloop, will facilitate rapid development of competition, encourage
11 facilities-based competition, and promote the deployment of advanced
12 services. [UNE Remand Order, paragraph 207].

13
14
15 **Q. In your opinion, which portions of the loop should be offered to CLECs?**

16 A. In general, CLECs should have the option of renting any portion of the loop. At a
17 minimum, to be consistent with the FCC's requirements and to ensure that the CLEC will
18 not be forced to pay for significantly more loop plant than they are actually using,
19 appropriate standard offering rates should be developed to allow CLECs to rent the
20 following specific portions of the loop:

21 - Copper feeder from the wire center to the FDI.

22
23 - Fiber-based electronic channels from the wire center to the FDI. (This should be
24 offered in DS0, DS1 and DS3 quantities.)

25
26
27 - Copper distribution plant from the FDI to the end use customer. (This is the only
28 portion, which Verizon plans to offer as "subloops")

29
30 - Copper distribution plant from the pedestal or terminal to the end use customer.
31 (This excludes distribution cable, but includes all of the drop, building cable or
32 riser cable, as well as the NID).

33
34 -The NID. (This is already available in Verizon's tariff, but is listed here for the
35 sake of completeness). |

36
37 **Q. Let's discuss the subloop cost studies. Have you identified any problems with**
38 **Verizon's development of these costs?**

1 A. Yes. Verizon has developed excessive rates, due to certain problems, which exist in its
2 cost calculations. Specifically, I have identified problems with Verizon's proposed
3 conduit costs, which escalate Verizon's recurring costs and rates. Additionally, there are
4 serious problems with the nonrecurring subloop cost studies, which greatly inflate the
5 proposed nonrecurring rates.

6

7 *Conduit Costs*

8

9 **Q. Let's discuss conduit costs. Can you explain the problem with this portion of the
10 Company's study?**

11 A. Yes. Verizon has estimated distribution subloop conduit and pole costs by applying the
12 ratio of feeder and distribution cable investment. For instance, if 50% of its cable
13 investment represents distribution cable, it has assumed that 50% of its conduit and pole
14 investment relates to distribution. This is not appropriate, and results in an overstatement
15 of the conduit costs associated with the distribution portion of the loop.

16 Distribution and feeder cable are not uniformly found among the underground,
17 buried and aerial plant categories. To the contrary, underground conduit is more
18 frequently used for feeder cable, and distribution cable is more frequently buried directly
19 in the ground. This follows directly from the fact that ILECs typically install sufficient
20 distribution cable to serve an area for 30 or more years, while they only install enough
21 feeder cable to accommodate 5 to 7 years worth of growth. As growth occurs, the ILEC
22 will periodically pull additional feeder cable through its conduit system.

23 This difference in standard engineering practice is reflected in the underground ("UG")
24 plant mix percentage inputs for distribution cable and feeder (both copper and fiber) in all
25 of the national cost models. For example, Table 4 shows the default plant mix inputs
26 used in the synthesis cost model adopted by the FCC. [Fifth Report and Order, CC
27 Docket No. 97-160, October 28, 1998.] The following table shows the analogous plant
28 mix percentages used in the Hatfield (HAI) model.

Table 5
Comparison of HAI's Underground
Plant Mix Percentages

Density	UG Distribution	UG Copper Feeder	UG Fiber Feeder
0	0.00%	5.00%	5.00%
5	0.00%	5.00%	5.00%
100	0.00%	5.00%	5.00%
200	0.00%	20.00%	10.00%
650	0.00%	40.00%	40.00%
850	0.00%	60.00%	60.00%
2550	5.00%	75.00%	75.00%
5000	5.00%	85.00%	85.00%
10000	10.00%	90.00%	90.00%

11

1 In both cases, for every density cell, the percentage of distribution contained in conduit is
2 less than the percentages of copper and fiber feeder contained in conduit.

3
4 **Q. Do you have a recommended solution to this issue which relies entirely upon**
5 **Verizon's own outside plant data?**

6 **A.** Yes. In order to estimate distribution conduit, it would be appropriate to look at the ratio
7 of underground distribution cable investment relative to total underground cable
8 investment. Similarly, to estimate distribution related pole costs, it would be appropriate
9 to apply the analogous ratio of distribution aerial cable investment to total aerial cable
10 investment. The investment data needed to directly apply this approach to each density
11 cell is not available in the cost study or supporting workpapers provided by Verizon.
12 However, sufficient information is available to develop an estimate of the relative
13 proportions of underground and aerial structures within the feeder and distribution
14 categories within each density cell.

15 Schedule 2 of my exhibit shows the process I used. I started with the statewide
16 average percentage of underground distribution plant, which was available in proprietary
17 workpapers we received from Verizon. I multiplied this percentage times the average
18 distribution loop lengths in each density cell to develop an estimate of the quantity of
19 underground distribution plant in each density cell. I performed a similar procedure for
20 aerial distribution plant, and used the same approach for feeder. As shown on Schedule 2,
21 this procedure results in an array of distribution and feeder lengths by structure category
22 for each density cell.

23 The underground distribution distances were then divided by the total
24 underground distances to develop the percentage of underground plant attributable to
25 distribution cable. For example, in Density Cell 1, I estimate that just **[Begin**
26 **Proprietary]** **[End Proprietary]** of the conduit is attributable to distribution cable;
27 the remaining conduit is attributable to feeder. The resulting percentage factors for
28 distribution are summarized in Table 6. These factors can be applied to total conduit
29 investment in order to estimate the amount of this investment which is attributable to the
30 distribution portion of the loop. The same process can be used to develop analogous
31 factors for feeder, which can be used in developing rates for the feeder portion of the
32 loop.

[End Proprietary]

7
8

Q. Have you calculated the impact of this approach on the subloop rates?

9
10

A. Yes. In general, the effect of this approach is to reduce the amount of conduit costs attributed to the distribution portion of the loop, and to increase the amount attributed to the feeder portion. Table 7 below shows the original monthly USLA (distribution) costs developed by Verizon, as well as the revised cost estimates which result from my recommended aerial and underground percentage factors.
